Title : On the Solubility of Chromite in Sulfuric Acid.
Orig Pub : Kemija u industriji, 1957, 6, No 7, 189-191

Abstract : The possibility of chromite (I) dissolution in a little excess of H_2SO_4 (50%) in presence of compounds of 6-valent Cr was investigated. The yield of solute Cr depends very much on the dispersion of I. The yield is 67.5%, if the particle size was about 100μ and it rises gradually with the dispersion increase. An addition of Fe neutralizes the solution. The method of using an excess of acid was used for the preparation of crystalline ferrosulfate and of the salt of 3-valent Cr with the necessary degree of acidity.

TITLE: Polarographic studies on metal oxinates in alcohol-water mixtures

SOURCE: Zeitschrift fur physikalische Chemie, v. 228, no. 3-4, 1965, 239-245.

TOPIC TAGS: polarographic analysis, organocopper compound, quinone, sulfonic acid, alcohol, chemical stability, dissociation constant

ABSTRACT: The stability of copper-8-hydroxyquinoline-5-sulfonic acid in the presence of various monofunctional alcohols was investigated with the aid of polarographic techniques. The stability was found to increase with increasing carbon numbers in the alcohol and/or with increasing alcohol concentration. There was an inverse relation between the degree of instability and dissociation constant of the aqueous alcohol mixture. Orig. art. has: 4 figures, 3 formulas, and 2 tables.
